

Salesforce Connector

Live Salesforce CRM in Copilot, trimmed by Salesforce's own sharing model.

What it is

Indexes Salesforce standard and custom objects (accounts, contacts, opportunities, cases, ...) so they are answerable in Copilot. Its defining feature is that it reproduces Salesforce's record-level **sharing model** as item permissions, so Copilot shows each record to exactly the people Salesforce would.

Property	Detail
Source	Salesforce CRM (live), read via the REST API + SOQL
Connects with	OAuth 2.0 client-credentials against a Salesforce Connected App
ACL model	Full sharing model: org-wide defaults, role hierarchy, sharing rules, public groups, queues, ControlledByParent
Resilience	No circuit breaker — uses adaptive concurrency + exact Retry-After instead
Runtime	Standalone .NET 10 Windows service · 975 automated tests

Signature capabilities

- Standard **and** custom objects, field-to-property mapping
- Sharing-model ACLs with role/group/queue expansion, cycle detection and a nesting-depth cap (fails closed to Private)
- Sovereign-cloud Graph endpoints supported; large-group ACL scale guard (ACL_MAX_ACES)
- Deletion sweep with a mass-deletion guard; checkpointed resumable crawls

Before setup — key values to request

Request these (see the full guide for the complete checklist)

Value / setting	Ask from
Salesforce org URL / My Domain	Salesforce administrator
Connected-app consumer key & secret + an API-enabled integration user	Salesforce administrator
List of objects/fields permitted for indexing	Salesforce admin / data owner
Entra tenant ID, app registration + secret or certificate, Key Vault URI	Entra tenant admin

Key signals to monitor

Metric / signal	Healthy looks like
salesforce_connector_items_ingested_total rising during a crawl	Climbs then plateaus at crawl end
..._dead_letter_depth	Near zero; investigate sustained growth
..._adaptive_concurrency_level	Dips under throttling, recovers to the configured max
..._last_crawl_completed_timestamp_seconds	Advances every scheduled crawl

Top troubleshooting

Symptom	First action
Token/401 errors at startup	Check connected-app credentials and that the API user is active/API-enabled
Users miss records they should see	Check Entra identity mapping (FederationIdentifier → Username → Email)
Frequent 429s / slow crawl	Expected under load — adaptive concurrency backs off; confirm Retry-After is honoured
Dead-letter queue growing	Read a sample record's error, fix the cause, then run retry-failed

Full detail: **01_Salesforce_Connector_Guide.docx** and the Tenant & Common Concepts Guide (00). Metric prefix shown is per-connector.
