

Seismic Connector

Seismic enablement content in Copilot — version-aware, with restricted content excluded at source.

What it is

Indexes the Seismic content library (documents, pages, LiveDocs). It tracks versions, keeps item permissions in step with Seismic, and excludes restricted (No-MNE) material before it ever reaches Copilot.

Property	Detail
Source	Seismic (sales enablement) content library, via its REST API
Connects with	OAuth 2.0 client-credentials
ACL model	Teamsite permissions → item permissions; never widens access when an identity is unresolved
Real-time	HMAC-signed webhooks (validate-before-parse, fail-closed) + polling backstop
Runtime	Standalone .NET 10 Windows service · 474 automated tests

Signature capabilities

- **Version-aware ingest:** new versions supersede; unpublish/expiry withdraws
- **No-MNE exclusion filter:** restricted/materially-non-public content excluded at ingest time
- Permission re-ACL by fingerprint: re-applies access for changed items without re-sending content
- Resume reconciles completed work so a mid-crawl change is not missed

Before setup — key values to request

Request these (see the full guide for the complete checklist)

Value / setting	Ask from
Seismic tenant / region and OAuth client id + secret	Seismic administrator
Permitted teamsites / libraries to index	Seismic admin / content owner
Webhook shared secret + inbound URL/port	Seismic admin + network team
Sign-off on the exclusion policy (what counts as No-MNE)	Compliance / content governance

Key signals to monitor

Metric / signal	Healthy looks like
seismic_connector_items_ingested_total / withdrawn	Ingest climbs; withdrawals track real removals
Webhook accepted vs rejected (401)	Mostly accepted
Re-ACL count	Small and steady; a storm indicates a bulk permission change
..._dead_letter_depth	Near zero

Top troubleshooting

Symptom	First action
Webhook 401 spike	Forgery vs secret-rotation mismatch — check, then re-sync the secret
Excluded content appears in Copilot	Check exclusions.json; run the reconciliation/repair sweep
Re-ACL storm	Usually a bulk permission change in Seismic — let it drain; confirm no widening
OAuth failures	Re-check client id/secret, region and token scope

Full detail: **03_Seismic_Connector_Guide.docx** and the Tenant & Common Concepts Guide (00). Metric prefix shown is per-connector.
