

Clarizen Connector

Planview AdaptiveWork (Clarizen) projects and financials in Copilot, with financial-field governance.

What it is

Indexes Clarizen projects, tasks and financial records. It uses the REST v2 API for incremental work and a bulk warehouse export (TDW) for efficient full crawls, and it can govern how financial fields are exposed.

Property	Detail
Source	Planview AdaptiveWork (Clarizen), REST v2 + CZQL; TDW bulk export for full crawls
Connects with	Clarizen session authentication (rate-limited by a daily API-budget governor)
ACL model	Project membership / groups → item permissions
Real-time	HMAC-signed webhooks (validate-before-parse, fail-closed) + signed-timestamp anti-replay; polling backstop
Runtime	Standalone .NET 10 Windows service · 877 automated tests

Signature capabilities

- **Financial-field governance:** filter (redact) by default, or tag / ACL-restrict
- TDW bulk export makes full crawls efficient at scale
- Deletion sweep with mass-deletion guards; two circuit breakers (source-side and Graph-side)
- Checkpointed resumable crawls; dead-letter (redacted by default) + retry
- **Content gate** (opt-in, CONTENT_GATE): attachment malware/injection scanning; an unscannable binary is stamped incomplete:, never clean

Before setup — key values to request

Request these (see the full guide for the complete checklist)

Value / setting	Ask from
Clarizen endpoint / org and a service account credential	Clarizen / Planview administrator
TDW (warehouse) access for bulk full crawls	Clarizen / Planview administrator
Webhook shared secret + an inbound URL/port the connector can receive on	Clarizen admin + network team
Chosen FINANCIAL_DATA_MODE (default filter; acl needs a group; tag labels but does not restrict)	Data governance owner

Key signals to monitor

Metric / signal	Healthy looks like
clarizen_connector_items_ingested_total	Climbs during crawl, then steady
Circuit-breaker state (source & graph): 0 closed / 1 half-open / 2 open	0 (closed) in normal operation
Webhook accepted vs rejected (401)	Mostly accepted; a 401 spike needs investigation
..._dead_letter_depth	Near zero

Top troubleshooting

Symptom	First action
Both breakers open / degraded mode	Check source API and Graph health; connector auto-recovers
Webhook 401 spike	Distinguish forged posts from a secret-rotation mismatch; re-sync the secret
TDW export fails to parse	Confirm the export includes the required id column

Clarizen Connector

Financial data appearing when it shouldn't	Verify FINANCIAL_DATA_MODE and re-run the crawl
Crawl aborts naming an undeclared Graph property	By design: declare it in graph-schema.json, re-run validate-config --strict, then crawl — records are never silently dead-lettered for a schema mistake

Full detail: **02_Clarizen_Connector_Guide.docx** and the Tenant & Common Concepts Guide (00). Metric prefix shown is per-connector.
